Objective of the Project

- To analyze banking customers based on their financial behavior.
- To segment customers into meaningful categories (High, Moderate, and Low Spenders).
- To identify relationships between total spending, balance, and credit limits.
- To create an interactive dashboard that supports data-driven decision-making.

Why Customer Segmentation Matters

- Helps in targeted marketing – personalized offers for different customer groups.
- Improves customer relationship management.
- Enables risk assessment and better credit scoring.
- Provides insights for product development and service customization.

Dataset Description

- Total Records: 8,950 customers
- Key Fields:
 - ~ Customer_Type (High/Moderate/Low Spender)
 - ~ Balance (Average balance maintained)
 - ~ Total_Purchases
 - ~ Credit_Limit
- Data Source: Simulated dataset prepared for analytical learning
- Tool Used: Microsoft Power

Steps Followed in Power BI

- Imported dataset into Power BI Desktop.
- Cleaned the data – removed unnecessary columns (like Customer ID).
- Created calculated fields and measures (total purchases, average credit limit, etc.).
- Designed visuals: bar charts, donut charts, KPI cards, and tree maps.
- Applied formatting for a clear, professional dashboard layout.

Dashboard Overview

- Bar Chart: Average Balance by Customer Type
- Tree Map: Total Spending by Customer Type
- Donut Chart: Total Customers by Segment
- Cards (KPIs):
 - ~Total Purchases
 - ~Average Credit Limit
 - ~Total Customers

Final Power BI Dashboard

Insights from the Analysis

- High Spenders contribute the maximum share of total spending.
- Moderate Spenders represent a balanced, stable segment.
- Low Spenders have limited purchasing power and lower balances.
- The average balance and credit limit are directly related to the spending type.
- Potential marketing strategies can be developed for each group.

Managerial & Business Relevance

- Enables data-driven decisions in customer management.
- Assists in credit limit allocation and loan marketing.
- Supports cross-selling and up-selling opportunities.
- Reduces churn by identifying at-risk customer segments.

Challenges & Limitations

- Data cleaning and formatting took significant time.
- Some records had missing or inconsistent entries.
- Lack of real-time banking data restricted deeper insights.
- Limited tool access outside Power BI environment.

Summary & Conclusion

- Power BI helped visualize customer data effectively.
- Customer segmentation provides valuable business insights.
- The project demonstrates the importance of analytics in banking.
- Future scope: integrating real-time dashboards and predictive analytics.

Thank You
